

I am working alone.

My project will be scraping data from IMDB, and rotten tomatoes to find information on movies, i.e. actors, budget, genre, director, time when the movie came out, if it was a sequel/book, and the technical specs.

I will try to estimate the profit a movie will make, and the score it will receive on rotten tomatoes.

I will use the data sets gathered from IMBD and rotten tomatoes.

I will probably use webscraping and pandas.

I will probably use mean error from actual data to determine how good my answers actually are.

I will do all the work, since I am working alone.
